#### **DETAILED ACTION**

### Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claim 3 is rejected under 35 U.S.C. 102(b) as being anticipated by Hooley et al, WO 01/23104 A2 (Hooley et al is cited in IDS filed 8/7/2006).

Re Claim 3, Hooley et al discloses the audio signal supply apparatus, which supplies an audio signal to a loudspeaker array constituted by a plurality of loudspeaker units, characterized by comprising: a branching unit that branches an input audio signal into two or more signals (*fig. 15: 1504; page 28, lines 21-24*); a first processing unit that performs a delay process and/or a weighting process for of the signal that is obtained by branching one audio signal and is to be supplied to the loudspeaker units in accordance with first provided directivity control information (*fig. 15: 1506; page 28, lines 21-27; page 10, lines 14-17*); a second processing unit that performs a delay process and/or a weighting process for other signal that is obtained by branching one audio signal and that is to be supplied to the loudspeaker units in accordance with second directivity control information that is provided (*fig. 15: 1506; page 28, lines 21-27; page 10, lines 14-17*); a directivity control unit that generates the first directivity control information and the second directivity control information so that a directional characteristic of the loudspeaker array obtained by the first process differs from a directional characteristic

of the loudspeaker array obtained by the second process, and supplying the generated information respectively to the first processing unit and the second processing unit (<u>fig. 15: 1506; page 28, lines 21-27; page 10, lines 14-17</u>); and an adding unit that adds the audio signal processed by the first processing unit to the audio signal processed by the second processing unit (<u>fig. 11: 506</u>).

### Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
  - 1. Determining the scope and contents of the prior art.
  - 2. Ascertaining the differences between the prior art and the claims at issue.
  - 3. Resolving the level of ordinary skill in the pertinent art.
  - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 3. Claims 1, 4 & 6 are rejected under 35 U.S.C. (2005) as being anticipated by Hooley et al, WO 01/23104 A2 in view of Yanagawa et al, US Patent 5,233,664 (Hooley et al is cited in IDS filed 8/7/2006).

Re Claim 1, Hooley et al discloses an audio signal supply apparatus for supplying an audio signal to a loudspeaker array constituted by a plurality of

G.M.

loudspeaker units (abstract), characterized by comprising: a delay unit that performs a delay process for each of audio signals to be supplied to the loudspeaker units in accordance with provided delay control information (page 18, lines 3-8); a weighting unit that weights each of the audio signal to be supplied to the loudspeaker units in accordance with gain control information that is provided (page 18, lines 17-28); a storage unit that stores a first directivity parameter (page 10, lines 14-17; page 9, lines <u>16-20</u>), and a second directivity parameter (<u>page 10, lines 14-17; page 9, lines 16-20</u>); an input unit that receives a selection instruction for the directional characteristic (page 10, lines 14-17; page 9, lines 16-20); and a directivity control unit that selects one of the directivity parameters in accordance with the input selection instruction, generates the delay control information and the gain control information based on the selected directivity parameter, and supplies the delay control information and the gain control information to the delay unit and the weighting unit, respectively (fig. 15: 1508, 1510; page 28, lines 21-27); but fails to disclose a directive parameter which sets a directional characteristic for the loudspeaker as a narrow directivity and sets another directional characteristic for the loudspeaker as a wide directivity. However, Yanagawa et al does (col. 1, lines 1-22).

Taking the combined teachings of Hooley et al and Yanagawa et al as a whole, one skilled in the art would have found it obvious to modify the audio signal supply apparatus for supplying an audio signal to a loudspeaker array constituted by a plurality of loudspeaker units (<u>abstract</u>), characterized by comprising: a delay unit that performs a delay process for each of audio signals to be supplied to the loudspeaker units in

accordance with provided delay control information (page 18, lines 3-8); a weighting unit that weights each of the audio signal to be supplied to the loudspeaker units in accordance with gain control information that is provided (page 18, lines 17-28); a storage unit that stores a first directivity parameter (page 10, lines 14-17; page 9, lines <u>16-20</u>), and a second directivity parameter (page 10, lines 14-17; page 9, lines 16-20); an input unit that receives a selection instruction for the directional characteristic (page 10, lines 14-17; page 9, lines 16-20); and a directivity control unit that selects one of the directivity parameters in accordance with the input selection instruction, generates the delay control information and the gain control information based on the selected directivity parameter, and supplies the delay control information and the gain control information to the delay unit and the weighting unit, respectively (fig. 15: 1508, 1510; page 28, lines 21-27) of Hooley et al with a directive parameter which sets a directional characteristic for the loudspeaker as a narrow directivity and sets another directional characteristic for the loudspeaker as a wide directivity as taught in Yanagawa et al (col. 1, lines 1-22) to prevent howling.

Claim 4 has been analyzed and rejected according to claims 1 & 3.

Re Claim 6, Hooley discloses the audio signal supply apparatus according to claim 3, but fails to disclose wherein a frequency property correction unit that corrects a frequency property for the signals obtained by branching the audio signal is arranged between the branching unit and the first processing unit. However, Yanagawa et al does (fig. 1: DF1-DFm).

Taking the combined teachings of Hooley et al and Yanagawa et al as a whole, one skilled in the art would have found it obvious to modify the audio signal supply apparatus according to Hooley et al with wherein a frequency property correction unit that corrects a frequency property for the signals obtained by branching the audio signal is arranged between the branching unit and the first processing unit as taught in Yanagawa et al (<u>fig. 1: DF1-DFm</u>) to filter out noise.

- 4. Claims 2 & 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hooley et al, WO 01/23104 A2 and Yanagawa et al, US Patent 5,233,664 as applied to claim 1 above, and further in view of Johnson, US Patent 6,181,796 B1.
- 5. Re Claim 2, the combined teachings of Hooley et al and Yanagawa et al disclose the audio signal supply apparatus according to claim 1, but fails to disclose wherein an amount of delays indicated by delay control information generated based on the second directivity parameter is 0 or an equal amount. However, Johnson does (*col. 10, lines 16-22*).
- 6. Taking the combined teachings of Hooley et al and Johnson as a whole, one skilled in the art would have found it obvious to modify the audio signal supply apparatus according to Hooley et al with wherein an amount of delays indicated by delay control information generated based on the second directivity parameter is 0 or an equal amount as taught in Johnson (*col. 10, lines 16-22*) to compensate for sounds in a non-sound proof environment.

Art Unit: 2615

7. Claim 5 has been analyzed and rejected according to claims 1-3.

## <u>Contact</u>

Any inquiry concerning this communication or earlier communications from the examiner should be directed to George C. Monikang whose telephone number is 571-270-1190. The examiner can normally be reached on M-F. alt Fri. Off 7:30am-5:00pm (est).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chin Vivian can be reached on 571-272-7848. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

George Monikang
